

Common Eastern Froglet *Crinia signifera*

When to look:

Breeding occurs all year except mid-summer

Ground-dwelling froglet with slender body and slightly pointed head, measuring 18-28mm in length.

Colour varies from dark brown to light grey. Ventral surface typically has white spots. Appearance is highly variable between populations however.

Distinctive horizontal pupil

Similar species:

Can be distinguished by other *Crinia* species by its distinctive 'crick crick crick' call.

Eggs are laid in clusters of 200, usually attached to submerged vegetation.

Tadpoles are brown or light grey scattered with dark flecks, around 36mm in length
